

Higgs Rupture: Dielectric Breakdown of the LC Lattice

$S(V) = \sqrt{1 - (V/V_{snap})^2}$ | $V_{snap} = m_e c^2 \sqrt{\alpha} / e$ | All from ave. core. constants

Collision Energy vs
Pair Production Threshold

Dielectric Saturation:
Compliance Collapse

Phase Transition:
Compliance → Mass

Dielectric Saturation Curve:
Axiom 4 Operator

HIGGS MECHANISM = DIELECTRIC RUPTURE

$V_{snap} = m_e c^2 \sqrt{\alpha} / e = 511.00$ kV
↓
 $S(V) = \sqrt{1 - (V/V_{snap})^2}$
↓
When $V \rightarrow V_{snap}$: $S \rightarrow 0$
 $\epsilon_{eff} \rightarrow 0$ (compliance destroyed)
↓
Trapped energy → rest mass:
 $M_W = 79923$ MeV
 $M_Z = 90624$ MeV
↓
Higgs = K4 breathing mode:
 $m_H = v/\sqrt{N_{K4}} = v/2$
 $= 124417$ MeV
 $\lambda = 1/8 = 0.125$

Mass Spectrum:
Topological vs Rupture
