

Standard Model Abstract: 1D Continuous String

AVE Reality: Discrete LC FDTD Solvers

The String Theory Isomorphism

Proposed analogy: String theory's 1D continuous vibrating filaments are analogous to the 1D acoustic phase flux connecting discrete LC array nodes.

String 'Tension' is analogous to spatial Capacitance (C); String 'Mass Density' is analogous to nodal Inductance (L). Formal identity proof not in corpus.

This discrete FDTD transmission logic generates qualitatively similar waveform behaviors to those modeled in M-Theory without positing unobservable 11D bulk dimensions.
